## Repeated Games

## Long-Run versus Short-Run Player

a fixed simultaneous move stage game

Player 1 is long-run with discount factor $\delta$
actions $a^{1} \in A^{1}$ a finite set
utility $u^{1}\left(a^{1}, a^{2}\right)$

Player 2 is short-run with discount factor 0
actions $a^{2} \in A^{2}$ a finite set
utility $u^{2}\left(a^{1}, a^{2}\right)$
the "short-run" player may be viewed as a kind of "representative" of many "small" long-run players

## Repeated Game

history $h_{t}=\left(a_{1}, a_{2}, \ldots, a_{t}\right)$
null history $h_{0}$
behavior strategies $\alpha_{t}^{i}=\sigma^{i}\left(h_{t-1}\right)$

## Equilibrium

Nash: usual definition
Subgame perfect: usual definition, Nash after each history

Observation: the repeated static equilibrium of the stage game is a subgame perfect equilibrium of the finitely or infinitely repeated game
strategies: play the static equilibrium strategy no matter what
"perfect equilibrium with public randomization"
may use a public randomization device at the beginning of each period to pick an equilibrium
key implication: set of equilibrium payoffs is convex

## Example: chain store game

normal form
fight
out

give in | $2,0^{*}$ | $-1,-1$ |
| :--- | :--- |
| 2,0 | $1,1^{* *}$ |

## Nash

subgame perfect is In, Give In
variation on chain store

| out |
| :--- |
| fight <br> give in |
| $2-\varepsilon, 0$ $-1,-1$ <br> 2,0 $1,1^{* *}$ |

now the only equilibrium is $\operatorname{In}$, Give In
payoff at static Nash equilibrium to LR player: 1
precommitment or Stackelberg equilibrium precommit to fight get $2-\varepsilon$
minmax payoff to LR player: 1 by giving in
utility to long-run player
precommitment/Stackelberg $=2-\varepsilon$
best dynamic equilibrium = ?
Set of dynamic equilibria
static Nash = 1
worst dynamic equilibrium = ?
$\operatorname{minmax}=1$

## Repeated Chain Store

finitely repeated game
final period: In, Give, so in every period
Do you believe this??

## Infinitely repeated game

begin by playing Out, Fight
if Fight has been played in every previous period then play Out, Fight
if Fight was not played in a previous period play In, Give In (reversion to static Nash)
claim: this is subgame perfect
clearly a Nash equilibrium following a history with Give In

SR play is clearly optimal
for LR player
may Fight and get $2-\varepsilon$
or give in and get $(1-\delta) 2+\delta 1$
so condition for subgame perfection

$$
\begin{aligned}
& 2-\varepsilon \geq(1-\delta) 2+\delta 1 \\
& \delta \geq \varepsilon
\end{aligned}
$$

equilibrium utility for LR

## General Deterministic Case

Fudenberg, Kreps and Maskin [1990]
utility to long-run player
$\max u^{1}(a)$
mixed precommitment/Stackelberg
pure precommitment/Stackelberg
$\bar{v}^{1}$ best dynamic equilibrium
Set of dynamic equilibria
static Nash
$\underline{v}^{1}$ worst dynamic equilibrium
minmax
$\min u^{1}(a)$

Characterization of Equilibrium Payoff $\alpha=\left(\alpha^{1}, \alpha^{2}\right)$ where $\alpha^{2}$ is a b.r. to $\alpha^{1}$
$\alpha$ represent play in the first period of the equilibrium
$w^{1}\left(a^{1}\right)$ represents the equilibrium payoff beginning in the next period
$v^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right)$
$v^{1}=(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right), \alpha^{1}\left(a^{1}\right)>0$
$\underline{v}^{1} \leq w^{1}\left(a^{1}\right) \leq \bar{v}^{1}$

## Characterization of Best/Worst Equilibrium Payoffs

 maximize $\bar{v}^{1}$, minimize $\underline{v}^{1}$ subject to$$
\begin{aligned}
& \alpha=\left(\alpha^{1}, \alpha^{2}\right) \text { where } \alpha^{2} \text { is a b.r. to } \alpha^{1} \\
& \bar{v}^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right) \\
& \bar{v}^{1}=(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right), \alpha^{1}\left(a^{1}\right)>0 \\
& \underline{v}^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right) \\
& \underline{v}^{1}=(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right), \alpha^{1}\left(a^{1}\right)>0 \\
& \underline{v}^{1} \leq w^{1}\left(a^{1}\right) \leq \bar{v}^{1}
\end{aligned}
$$

## Remarks

1) problem simplifies if static Nash $=$ minmax
2) if $v^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right)$ then $v^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta \underline{v}^{1}$
simplification: split into two problems by defining $n^{1}$ as static Nash payoff

$$
\begin{aligned}
& n^{1} \leq w^{1}\left(a^{1}\right) \leq \bar{v}^{1} \\
& \underline{v}^{1} \leq w^{1}\left(a^{1}\right) \leq n^{1}
\end{aligned}
$$

as $\delta \rightarrow 1 w^{1}\left(a^{1}\right) \rightarrow \bar{v}^{1}, \underline{v}^{1}$ in the two problems so this is OK

## max problem

fix $\alpha=\left(\alpha^{1}, \alpha^{2}\right)$ where $\alpha^{2}$ is a b.r. to $\alpha^{1}$
$\bar{v}^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right)$
$\bar{v}^{1}=(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right), \alpha^{1}\left(a^{1}\right)>0$
$n^{1} \leq w^{1}\left(a^{1}\right) \leq \bar{v}^{1}$
how big can $w^{1}\left(a^{1}\right)$ be in = case?

Biggest when $u^{1}\left(a^{1}, \alpha^{1}\right)$ is smallest, in which case
$w^{1}\left(a^{1}\right)=\bar{v}^{1}$
$\bar{v}^{1}=(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta \bar{v}^{1}$
conclusion for fixed $\alpha$
$\min _{a^{1} \mid \alpha\left(a^{1}\right)>0} u^{1}\left(a^{1}, \alpha^{2}\right)$
i.e. worst in support
$\bar{v}^{1}=\max _{\alpha^{2} \in B R^{2}\left(\alpha^{1}\right)} \min _{a^{1} \mid \alpha\left(a^{1}\right)>0} u^{1}\left(a^{1}, \alpha^{2}\right)$
observe:
mixed precommitment $\geq \bar{v}^{1} \geq$ pure precommitment

Modified Chain Store Example

|  | out | in |
| :--- | :--- | :--- |
| fight | $2-\varepsilon, 0$ | $-1,-1$ |
| give in | 2,0 | 1,1 |

| $p$ (fight) | BR | worst in support |
| :--- | :--- | :--- |
| 1 | out | $2-\varepsilon$ |
| $1 / 2<p<1$ | out | $2-\varepsilon$ |
| $0<p<1 / 2$ | in | -1 |
| $p=0$ | in | 1 |

check: $w^{1}\left(a^{1}\right)=\frac{\bar{v}^{1}-(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)}{\delta} \geq n^{1}$ as $\delta \rightarrow 1$ then $w^{1}\left(a^{1}\right) \rightarrow \bar{v}^{1} \geq n^{1}$
min problem
fix $\alpha=\left(\alpha^{1}, \alpha^{2}\right)$ where $\alpha^{2}$ is a b.r. to $\alpha^{1}$
$\underline{v}^{1} \geq(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta w^{1}\left(a^{1}\right)$
$\underline{v}^{1} \leq w^{1}\left(a^{1}\right) \leq n^{1}$

Biggest $u^{1}\left(a^{1}, \alpha^{1}\right)$ must have smallest $w^{1}\left(a^{1}\right)=\underline{v}^{1}$
$\underline{v}^{1}=(1-\delta) u^{1}\left(a^{1}, \alpha^{2}\right)+\delta \underline{v}^{1}$
conclusion
$\underline{v}^{1}=\max u^{1}\left(a^{1}, \alpha^{2}\right)$
or
$\underline{v}^{1}=\min _{\alpha^{2} \in B R^{2}\left(\alpha^{1}\right)} \max u^{1}\left(a^{1}, \alpha^{2}\right)$
that is, constrained minmax

## Sample Calculation

|  | L | M | R |
| :--- | :--- | :--- | :--- |
| U | $0,-3$ | 1,2 | 0,3 |
| D | $0,3^{*}$ | 2,2 | 0,0 |

static Nash gives 0
minmax gives 0
worst payoff in fact is 0
pure precommitment also 0

## Mixed Precommitment

$p$ is probability of up
to get more than 0 must get $S R$ to play $M$
$-3 p+(1-p) 3 \leq 2$ and $3 p \leq 2$
first one
$-3 p+(1-p) 3 \leq 2$
$-3 p-3 p \leq-1$
$p \geq 1 / 6$
second one
$3 p \leq 2$
$p \leq 2 / 3$
want to play D so take $p=1 / 6$
get $1 / 6+10 / 6=11 / 6$
utility to long-run player
$\max u^{1}(a)=2$
mixed precommitment/Stackelberg=11/16
$\bar{v}^{1}$ best dynamic equilibrium=1
pure precommitment/Stackelberg=0
Set of dynamic equilibria
static Nash=0
$\underline{v}^{1}$ worst dynamic equilibrium=0
minmax=0
$\min u^{1}(a)=0$

## Calculation of best dynamic equilibrium payoff

$p$ is probability of up

| $p$ | ${ }^{2} R^{2}$ | worst in support |
| :--- | :--- | :--- |
| $<1 / 6$ | L | 0 |
| $1 / 6<p<5 / 6$ | M | 1 |
| $\mathrm{p}>5 / 6$ | R | 0 |

so best dynamic payoff is 1
